

Synthetic Sub-Figure Merge Fixture

This fixture tests that two vertically-stacked vector clusters separated by a sub-caption line are merged into a single image by the `_merge_sub_figure_clusters` pass in `vector_images.py`.

The pipeline must produce exactly one vector image spanning both panels, with (a) and (b) sub-captions as italic paragraphs below.

(a) Upper sub-figure

(b) Lower sub-figure

Figure 1: Multi-panel sub-figures

The two panels above are rendered as a merged vector image. Sub-captions (a) and (b) appear as italic paragraphs below the image.
